Meet the fan designer

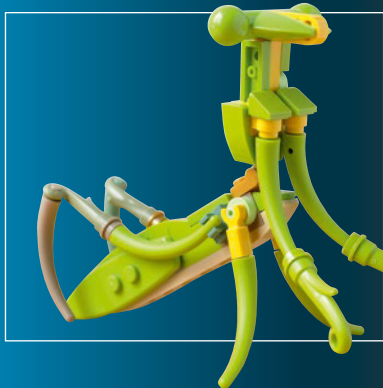

José María from Spain, known by his friends as 'Chema' and by the LEGO® Ideas community as 'hachiroku24', has studied physics and fine arts, and currently works full-time running his own YouTube channel about LEGO building. A lifelong fan, he constantly finds inspiration for new builds in his hobbies – movies, comics, photography and nature:

'I love animals. I don't have a background in biology or entomology, but I've always found insects interesting, and loved learning about different species and their rules and roles in our ecosystem – predators, vital pollinators with incredible jumps, webs, flying techniques, giant horns, the colours... They look like nothing else on our scale, almost otherworldly! You won't see these popular insects together in real

life (they are from completely different parts of the world), but I like the little dioramas we added, to show the insects looking alive, like in nature. And each of them has very different building techniques that I hope people will really enjoy. Seeing your own LEGO set on shelves is a dream I could only achieve through LEGO Ideas. Thanks to everyone who supported the idea!'

The insects from José's original submission to LEGO Ideas

Curious crawlers and majestic moths

Insects have lived on Earth for nearly 500 million years and roamed across every continent since long before dinosaurs existed. With more than one million identified species and around 1.4 billion living specimens per human at any given time, insects play a vital role in maintaining healthy ecosystems everywhere. Antarctica is currently the most

inhospitable insect habitat, with only one species registered – the Antarctic midge. But cold climates don't scare away all bugs. The Arctic tundra alone boasts more than 2,000 species! Over time, these resilient critters have evolved and developed awe-inspiring strengths and survival skills and helped sustain millions of lifeforms.

(Morpho peleides)

Blue morpho butterfly

Indigenous to Mexico, Central America and South America, the blue morpho butterfly is a spectacular work of art. Females are brownish in colour, while the male's wings consist of millions of scales that diffract light and reflect iridescent hues of blue. With a wingspan ranging from 7.5 to 20 cm (3 to 8 inches), it's easy to spot and, unlike many other butterflies, it flies in almost any type of weather. Blue morphos are not picky eaters. They enjoy tropical fruits, tree sap and rotting flesh. In their early caterpillar stage, they may even cannibalise each other! In this model, inspired by real life, the blue morpho is accompanied by a friend, the honeybee, on their joint mission to pollinate a blooming bromeliad.

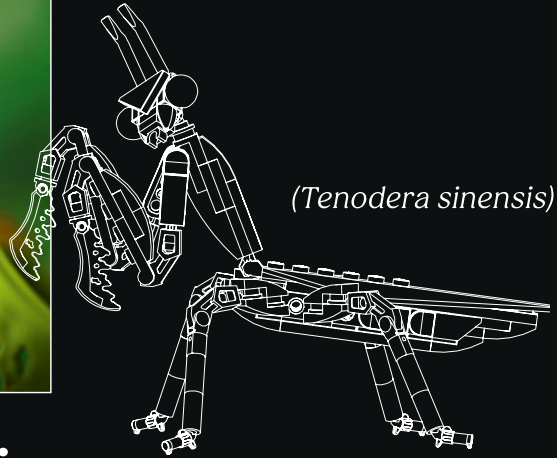

Hercules beetle

Being named after a Greek hero famous for his strength gives a bug something to live up to. Over a 19-21-month period, the formidable Hercules beetle grows from egg to pupal stage and finally metamorphoses into one of the world's largest beetles. An adult male grows up to 18 cm (7 inches) long, including the horn, which he uses to body-slam rival males and impress the female objects of his affection. The impressively strong exoskeleton protects his wings, and the hard shell also comes in handy if he's knocked off a tree branch during battle. Native to the rainforests of Central South America, he scours the ground for rotting fruits, trees and mushrooms like the *Clitocybula azurea* in this model.

(*Dynastes hercules*)

Chinese mantis

Perfectly colour-coordinated camouflage to hide among the *Emmenopterys henryi* branches: check. Lightning-fast reflexes to strike down unsuspecting grasshoppers, ladybirds and occasionally their own mates: check! Five eyes and a head that turns 180 degrees for optimal predator and prey detection: check. Its three middle eyes mainly register light, while the bigger ones on each side register movement. The Chinese mantis has developed highly effective, protective and deadly traits to thrive on several continents. One of its only natural enemies is actually the chameleon. Mainly found in Europe, North America and Asia, mantises can range in size from 5 to 12 cm (2 to 5 inches), with females typically a bit larger than males.

From the LEGO® Ideas design team

'I love LEGO® models that people don't initially recognise as LEGO bricks! José's insects have so much character, and each display tells a story inspired by the biome they inhabit. Making them free-standing was a challenge, as they have very thin and poseable limbs and I wanted to ensure this was carried through into the final model. We decided to create the insects on an approximate life-size scale and developed new decorations for the smaller 7-spotted ladybug and the honeybee. We have a fun little Easter egg you can only spot while you are building the model, and I hope fans appreciate the attention to detail.'

- Jordan David Scott, LEGO Ideas Design Manager

'José's original model is so well designed! Giant bugs are fascinating. They seem alien in our world. I did a lot of research on bugs and tried to translate the detailed patterns, eyes etc. into the LEGO graphics style. A mantis' eyes are crazy detailed and complex, so that was a super fun challenge! I am really happy with how the graphic on the butterfly's wings ended up integrating with the pattern in the build. On the butterfly, you might notice that the 1x1 round flat tile with a white spot on it is used as part of the butterfly's pattern. This deco is actually used as eyes for different LEGO animals and characters!'

- Kirsten Bay Nielsen, LEGO Ideas Graphic Designer
